

Sharp capacity boundary and its nonsquare channel return

Complete finite templates, $t \leq 120$

Sharp original prime example

$$t = 6, \quad j = 5, \quad h = 19$$

$$\text{Div}(j^2) = \{1, 5, 25\}$$

residues mod 19: 1, 5, 6

canonical $W = 6$ absent; finite $W = 25$ present

$$p = 825241$$

$$4/p = 1/217170 + 1/(825241 \cdot 43434) + 1/(825241 \cdot 5)$$

Blue points are an exact finite enumeration of the proved templates; the boundary curve is the theorem, not a fit.
