

Prime-local reciprocal fibres retain the E/M arithmetic type

Exterior channel E

root reductions: (0, 0, 4)

$$\mathcal{A}_E = \mathbb{Q}_p^3 \times K_{ram}^2$$

$$v_p(d_1, d_2, d_3) = (1, 1, 0)$$

$$\mathcal{O}_E = \{z : z_1 \equiv z_2 \pmod{p}\}; \text{ index } p$$

Middle channel M

three distinct root reductions

$$\mathcal{A}_M = \mathbb{Q}_p^3 \times K_{unr}^2$$

all d_i are units; one square, two nonsquares

$$\mathcal{O}_M = \mathbb{Z}_p^3; \text{ maximal order}$$

Each side has seven geometric affine branches and exactly three $\mathbb{Q}_p$ -points; the field and integral-order types differ.
